Introduction

IMPORTANT

Some illustrations may show guards removed. DO NOT operate equipment without guards.

Upon receipt of shipment:

- Compare shipment with packing slip. Contact factory regarding discrepancies.
- Inspect packages for shipping damage. Contact carrier regarding damage.
- Accessories may be shipped loose. See accessory instructions for installation.

Dorner's Limited Warranty applies.

Dorner has convenient, pre-configured kits of Key Service Parts for all conveyor products. These time saving kits are easy to order, designed for fast installation, and guarantee you will have what you need when you need it. Key Parts and Kits are marked in the Service Parts section of this manual with the Performance Parts Kits logo

Dorner reserves the right to make changes at any time without notice or obligation.

Warnings – General Safety

Product Description

Refer to Figure 1 for typical components.

Figure 1

Specifications

Conveyor Supports:

Maximum Distances:

1 = 914 mm (36")

2 = 3000 mm (118")*

3 = 914 mm (36")

* For conveyors longer than 3000 mm (118"), install support at joint.

Note: Additional support required on 180° curve modules.

Figure 2

Introduction

The main purpose of this manual is to help self-building end users, with little or no prior experience, to assemble a FlexMove conveyor system. Each chapter includes detailed instructions and pictures showing how to assemble the different parts. Most pictures in the manual include parts from the FS conveyor system, but all instructions are applicable to the FH, FK, FS, FM, FC, FL, FU and FV.

Document Disposition

The document is divided into the following five main parts:

- · Installation site preparations
- · Tools and fasteners
- Assembly
- · Start-up and testing

Initial Assembly Planning

Systematically working planning is required:

- Fully understand and studying the assembly drawing.
- Ensure the necessary tools are required.
- Ensure all the parts and materials are well prepared in advance, following the parts list.
- Enough space for conveyor installation is important.
- Ensure the floor is even and so the foot can be properly attached on the floor.

Safeguarding

All pinch and shear points, as well as other exposed moving parts that present a hazard to users, is recommended to be safe guarded. Cleat conveyor chain is more susceptible of creating pinch and shear points than plain chain.

When two or more pieces of equipment are interfaced, special attention must be given to the interfaced area to ensure proper safeguarding.

For overhead conveyors, guards must be provided if products fall off the conveyor for some reason. The same applies to all incline, decline and vertical conveyors.

Considerations

When correctly applied, the conveyor components are safe to use or maintain. It is, however, necessary for those responsible to design, installation, operation and maintenance to be aware of certain areas when special caution is required.

End Drive Unit

The chain slack of a normal direct drive unit must be maintained during the system lifetime.

Idler Unit

The opening between links (when they turn around idler) could be a potential risk. The idler end should not be accessible during conveyor operation.

Catenary Drive Unit

The bridge area where the chain goes down should not be accessible during conveyor operation.

Assembly Order

During the conveyor assembly, the following items can be used as a checklist:

- Cut all beams to desired length.
- Connect all feet and structural beams.
- · Mount conveyor beam support brackets.
- Assembly conveyor beams and mount them onto the support structure.
- Mount drive and idler unit at the end of the conveyor.
- Mount slide rail onto the conveyor beam.
- Loosen the slip clutch at the drive unit.
- Check any obstruction of the conveyor with a short piece chain.
- Assemble and mount necessary chain onto the conveyor.
- Mount guide rail and other accessories required onto the conveyor.
- Tighten the slip clutch with suitable friction.
- Read the final preparations at the end of this manual.

Tools General

Tools

To assemble a FlexMove Conveyor, you may need most of the tools listed on the following page. Not all are essential, but they will make your work easier and efficient.

Hand Tools

- Wrench
- Slide rail cutter
- Set of metric hex keys
- Counter sink bit
- Drill fixtures for slide rail
- Riveting tool
- In addition, the tools listed below can be useful:
 - Files
 - Socket wrench
 - Screwdriver
 - Pliers
 - Knife (burr of slide rail)
 - Flush cutting pliers
 - Soft head hammer
 - Chain tools (for chain installation and dismantle)
 - Level

Power Tools

- Hand drill
- Drill bit (for fixing slide rail)

Fasteners

Standard Fasteners

Standard Fasteners (Figure 3):

- M8 = Washer, Countersink Cap Screw, Nut, Lock Nut
- M6 = Washer, Countersink Cap Screw, Nut, Lock Nut

Figure 3

Square Nut

Square nuts (Figure 4) can be slid into T-slot of FlexMove conveyor and support beams. They do not stay in place in vertical positions and have to be inserted from the end of beam. Remember to put in a sufficient number before completing the assembly.

Figure 4

Spring Nuts

Spring nuts (Figure 5) can be inserted into the T-slot of FlexMove conveyors and support beams. They do not stay in place in vertical positions.

Figure 5

Connecting Strip

Connecting strips (Figure 6) are used for joining end to end of beams. Use hex key and set screws when attaching the connecting strip to the beam.

Figure 6

T-Bolt

T-bolts (Figure 7) can be entered from the beam side, and when turned 90 degrees they will stay in place after tightening with lock nuts. Use lock nuts to facilitate T-bolt turning in slot. The indication groove in the T-bolt should be at 90 degrees to the conveyor T-slot. T-bolts are used when attaching support brackets, guide rails and drip trays to the conveyor beam. T-bolts should not be used when fine adjustment for exact positioning is required (use square nuts or spring nuts for this type of application). Do not use T-bolts with support beams.

Figure 7

Pre installation Information

Cutting FlexMove Beam

Cutting is required for all 3m beams, including a precise cut to 3m lengths. Study your drawing to determine the beam lengths required before cutting.

Saw Requirements

The circular cross-cut saw used for aluminum profile cutting must be equipped with carbide tip saw circulating at high speed for a clean cut. The saw should have the ability of cutting the largest profile in one single cutting action.

WARNING

All safety precautions issued by the cutting saw manufacturer should be followed at all the times.

Working Site

You should use a special area for cutting beams in order to keep the assembly area clean.

Quality of Cut

If burrs are evident, they must be removed prior to assembly. Make sure the cut is straight for proper assembly.

Assembly

The basic FlexMove conveyor structure consists of five component groups (See (Figure 8) and (Figure 9)):

Figure 8

Figure 9

- Support structure
- · Conveyor beams, straight sections, and bends
- Drive and idler units
- Chains
- · Guide rail assembly components
- Other accessories

The first step in the assembly process is to assemble the support structure, which consists of feet, support beams, and beam support brackets. Most conveyor support designs are based on vertical support beams, combined, if necessary, with horizontal support beams. There are also a number of different feet and beam support brackets, so check which ones are suitable to use in your application.

Foot Installation

1. Insert hex head screws and washers (Figure 10, item 1) into the holes on the side of the foot. Use the screws to fasten foot connecting strips to the inner side of the foot. Leave loose.

Figure 10

2. Slide the connecting strips (Figure 11, item 1) into the structural beam T-slots.

Figure 11

3. Raise the beam from the bottom of the foot approximately 40-50 mm (Figure 12, item 1), to allow for height adjustment later in the assembly.

Figure 12

4. Tighten the screws using a wrench (Figure 13, item 1).

Figure 13

Conveyor Installation

Conveyor beams are mounted on to the support structure by means of support brackets. There are three different types of conveyor beam support brackets. They all serve the same purpose but are connected to the structural beams in different ways.

Option 1

Horizontal beam support brackets (60mm or 80mm) (Figure 14, item 1) are used for horizontal support structure mounted to 64x64mm or 80x80mm support beams.

Figure 14

Option 2

Vertical beam support brackets (Figure 15, item 1) are used with vertical support beams and are made from aluminum.

Figure 15

Option 3

Dual side mounting brackets (Figure 16, item 1) are used to support 180° wheel corners.

Figure 16

Mounting Conveyor Beam Support Bracket

 Attach screws, nuts and washers to the support bracket (Figure 17, item 1) before mounting. (Screws and square nuts are support beam fasteners; T-bolts and nuts are conveyor beam fasteners.) Slide the square nuts of one support bracket into the support beam T-slots. Tighten the screws. Make sure that the support bracket is aligned with the beam cross-section (Figure 17, item 2) as shown in the drawing.

Figure 17

2. Insert the square nuts of the second support bracket (Figure 18, item 1) into the support beam T-slots. Slide the bracket down so that it does not protrude above the cross-section of the beam.

Figure 18

3. Use a soft hammer or mallet to mount an end cap (Figure 19, item 1) on to the support beam.

Figure 19

4. Mount the first support bracket (Figure 20, item 1) to the conveyor beam (Figure 20, item 1). Pull the second bracket up and insert the T-bolts into the conveyor beam T-slot. Tighten the nuts.

Figure 20

Conveyor Beam Installation

The next step is to connect conveyor beams – straight sections and bends – to each other. Connect all conveyor beams according to the instructions below.

1. Connect two conveyor beam ends by inserting connecting strips (Figure 21, item 1) into the beam inner T-slots. Use two connecting strips per beam joint.

Figure 21

2. Make sure that the set screws (Figure 22, item 1) do not prevent the connection strips from sliding into place.

Figure 22

3. Tighten the set screws using a hex key (Figure 23, item 1).

Figure 23

NOTE

Assemble the entire conveyor beam structure in the same way. If the conveyor beam is too long to mount onto the support structure in one continuous length, assemble shorter lengths and connect them to each other once fastened to the support beams.

Drive Unit and Idler End Unit Installation

Drive End

1. Mount the end drive unit (Figure 24, item 1) on to the end of the conveyor: Release the four set screws that are inserted into the drive unit connecting strips. Insert the connecting strips into the T-slot of the beam you want attached to the end drive unit. Make sure that the set screws do not prevent the connecting strips from sliding into place.

Figure 24

2. Tighten the set screws using a hex key (Figure 25, item 1).

Figure 25

Drive Tail Support Brackets

Attach the drive tail support brackets (Figure 26, item 1) to the slot (Figure 26, item 2) in the drive tail with the T-bolts and hex nuts. The brackets should be located closest to the frame (Figure 26, item 3).

Figure 26

Idler End

1. Insert the idler unit (Figure 27, item 1) connecting strips into the T-slots of the beam end and tighten it.

Figure 27

2. Tighten the set screws using a hex key (Figure 28, item 1).

Figure 28

The opening between the links when they turn around the idler could be a risk. Idler ends should not be accessible during conveyor operation.

Attaching Slide Rail in Straight Beam

 Start the slide rail assembly at an idler end unit (Figure 29, item 1). Separate the top and bottom flange of the slide rail at the end of rail and press into place.

Figure 29

2. Attach the six slide rails onto the conveyor frame in the locations shown in **Figure 30**.

Figure 30

3. Make sure the slide rail (Figure 31, item 1) is properly mounted and snaps onto the beam. The longer flange of the slide rail must always face inside of the beam (See Figure 32).

Figure 31

Figure 32

4. The slide rail (Figure 33, item 1) must be mounted across the entire beam section. Remember to mount slide rails on both top and bottom side of the beam (unless top running chain only).

Figure 33

Slide Rail End Installation at Connector Beam

1. Cut both slide rail ends at a 35° angle. The beginning of a new slide rail (in the direction of travel) must cut back at a small angle (Figure 34, item 1).

Figure 34

 Allow a space of approximately 10 mm (Figure 35, item 1) between two slide rail ends. The travel direction is indicated by an arrow.

Figure 35

3. Do not place two slide rail joints (Figure 36, item 1) opposite each other. Make sure there is a distance of at least 100 mm (Figure 36, item 2) between them to make the chain run smoother. This does not apply to slide rail that begins by an idler unit or after a drive unit, where joints are always parallel.

Figure 36

Try to let the slide rail run in as continuous lengths as possible by reducing number of breaks, except in circumstances stated below:

- It is recommended to use short slide rails 2–3m (78-3/4"–118") where chemicals may have an effect on the slide rail composition.
- It is important to cut the slide rail and allow for elongation in high load areas. Cutting is required in wheel and horizontal bends (see following page), at idler units and where the conveyor will be heavily loaded. This prevents the slide rail from stretching out and entering into the drive unit, which may block the chain movement.
- Never join slide rail in horizontal or vertical bends, since forces are higher on the slide rail in these sections. Instead, place the joint before the bend.
- Avoid joining slide rails on top of conveyor beam joints.

FlexMove FV (260 mm) Conveyor System

Slide Rail Installation at Horizontal Plain Bends and Vertical Bend

In plain bends with a small radius, the slide rail for the inner bend should be cut so that it is only 10 mm wide in the bend. This is to prevent an uneven slide rail surface. Stretch the slide rail while mounting.

Drilling Slide Rail

1. Drill two holes near the beginning of each slide rail section. Use the drill fixture (Figure 37, item 1) to ensure clean-cut holes and the correct location of the holes. The holes must be at the leading edge of the joint piece, in the direction of travel, to hold the slide rail in place when the conveyor is in use. Use a well sharpened 4.3mm, #18, or 11/64" drill bit.

Figure 37

Use a bigger drill bit or countersink bit (Figure 38, item 1) to deburr and countersink the holes. Also make sure that there are no metal filings left underneath the slide rail.

Figure 38

Fixing Slide Rail

The beginning of each slide rail section must be fixed to the beam, since the chain will cause the slide rail to be pushed forward. A slide rail which moves into a drive unit can block the chain completely. The riveting method is more secure if the conveyor will run with high operational speed or be heavily loaded.

Nylon Screw

1. Insert the nylon screws (Figure 39, item 1) into the holes using a hex driver until the screw is flush with the bottom of the slide rail.

Cut off the head of nylon screws by using flush cutting pliers (Figure 40, item 1) or soft hammer and knife (Figure 41, item 1). Remember, the cut must be made away from the joint, in the direction of chain travel.

Figure 40

Figure 41

3. After the cut, make sure the slide rail surface is smooth and the nylon screws do not protrude over the slide rail surface. Use a file (Figure 42, item 1) to file off the protruding edge if uneven surface is found.

Figure 42

NOTE

Nylon screws can be used multiple times before being discarded. Ensure bottom of screw is cut square before re-using.

Aluminum Rivet

1. Insert the aluminum rivets (Figure 43, item 1) into the holes (Figure 43, item 2).

Figure 43

2. Clamp the aluminum rivet by using crimping pliers (Figure 44, item 1).

Figure 44

Checking Slide Rail and Rivet Condition After Fixed

- 1. Ensure slide rails do not protrude due to the overpressing during rivet process.
- 2. Check that the rivets do not protrude over the surface of the slide rail. Check both top and underneath surface of slide rail for protruding metal. (See Figure 45.)

Figure 45

Joining Chain End

Assemble the chain by inserting the steel pin that comes with each chain link, into the opposite end of another link. Do this by using the FlexMove pin insertion tool.

1. Insert the plastic pivot (Figure 46, item 1) with the slot facing outward.

Figure 46

2. Insert the steel pin (Figure 47, item 1) halfway, using a pair of pliers. Always use new steel pins and plastic pivots when joining chain ends.

Figure 47

3. Line the FlexMove chain tool (Figure 48, item 1) up with the pin (Figure 48, item 2). Slowly depress the trigger until the pin seats. A slight detent will be felt when pin is seated.

Figure 48

4. Check that the chain is flexible in the joint and that the pin does not stick out or go through the other side (Figure 49, item 1).

Figure 49

Chain Installation at Drive Unit

1. Insert the chain (Figure 50, item 1) into the underside of the drive unit (Figure 50, item 2). Make sure the chain will be moving in the correct direction, as indicated by the arrow (Figure 51, item 1) located at the side of all chain links.

Figure 50

Figure 51

2. Feed the chain along the conveyor (Figure 52, item 1) by pulling it through the idler unit and back to the drive unit.

Figure 52

3. Join 5 meter lengths of chain when necessary. (See Figure 53.)

Figure 53

4. Tension the chain and remove links if necessary, so that the chain will exhibit some slack at the drive unit. Put in the stainless steel pin (Figure 54, item 1) at the hole provided at drive unit and join the chain.

Chain Assembly at Chain Disconnecting Module FVCC

1. Loosen the screws (Figure 55, item 1) on the beam section flanges.

Figure 55

2. Remove the flange (Figure 56, item 1) so that the chain becomes accessible.

Figure 56

Figure 54

Clamp the chain (Figure 57, item 1) to the beam profile. Use the FlexMove chain tool (Figure 57, item 2) to remove a steel pin from the chain, so that two links are separated.

Figure 57

Remove excess links and use the chain tool (Figure 58, item 1) to put the chain back together again.

Figure 58

Weighted Take-Up

NOTE

Remove as much chain slack as possible that will still allow idler to be installed.

1. Install idler pulley assembly (Figure 59, item 1) onto belt (Figure 59, item 2).

Figure 59

- 2. Make sure teeth on pulley and guard are facing mating teeth on take up box assembly.
- 3. Raise weighted take up box assembly, with plate (Figure 60, item 1) on idler pulley assembly on outside of outer plate (Figure 60, item 2) of weighted take up assembly.

Figure 60

4. Raise weighted take up assembly (Figure 61, item 1) with notch (Figure 61, item 2) in assembly mating with stud (Figure 61, item 3) on conveyor frame.

Figure 61

5. Install and tighten two screws (Figure 62, item 1) on each side to secure assembly to frame.

NOTE

- For standard belt use these holes (Figure 63, item 1).
- For friction insert belt use these holes (Figure 63, item 2).

Install Guiding

All guiding must be located and installed by the end user.

Length Adjustment of the Conveyor Chain

End Drive Units and Catenary Drive Units

- 1. The conveyor chain is carried out at the drive end of the conveyor.
- 2. The transmission guard cover must be removed from the drive unit and the slip clutch disengaged or transmission chain removed. The conveyor chain should now be free to travel within the conveyor beam profile.
- 3. Catenary protection plates should also be removed to allow easy access for the conveyor chain pin insertion tool.
- 4. The conveyor chain should be tensioned within the conveyor system by pulling down the conveyor chain at the chain catenary on the underside of the drive unit. Clamp across the conveyor chain to trap the chain on to the beam profile. The clamp should be placed over the edges of the drive unit to reduce the risk of damage to the aluminum profile.
- 5. Remove all slack links from the conveyor chain using the pin insertion tool.
- 6. Rejoin the conveyor chain using a new steel pin and plastic pivot.
- 7. Remove the chain clamp and replace the catenary protection plate and transmission chain. The slip clutch should also be reset.
- 8. Replace the transmission guard cover. The conveyor is now ready for operation.

Intermediate Drive Units and Horizontal Bend Drive Unit

- 1. Conveyors which have no conveyor chain slack should be assembled with a special section of conveyor beam (FVCC), which allows for the chain to be easily inserted and adjusted for tension. (See "Chain Assembly at Chain Disconnecting Module FVCC" on page 20.)
- 2. Remove the lower part of this conveyor beam section by releasing the four screws.
- 3. Lift the chain from this section of the beam and clamp the conveyor chain as described above. Adjust the chain tension as for end and catenary drive units.

FlexMove FV (260 mm) Conveyor System

Guide Rail System Installation

Guide rails are used to guide products being conveyed, but also to prevent them from falling off the conveyor. Guide rails are supported by guide rail brackets attached to the sides of the conveyor beam. Follow the mounting instructions for the type of bracket used in your application.

Brackets should be placed approximately 500 to 1000 mm apart depending on type of product and if accumulation occurs or not. If brackets are spaced at greater distances than 1000 mm, there is a possibility that guide rails will become deformed due to excessive force.

High Side Guiding

1. Install stud (Figure 64, item 1) onto retaining clip (Figure 64, item 2) with nut (Figure 64, item 3).

Figure 64

 Install stud (Figure 64, item 1) into side rail channel (Figure 64, item 4). The end clips should be no greater than 12" from end of the conveyor. 3. Fasten retaining clip (Figure 65, item 1) to conveyor with nut (Figure 65, item 2) on stud.

Figure 65

Be certain that slot (Figure 65, item 3) is close to vertical when finished tightening nut.

- 4. Tighten nuts (Figure 65, item 2).
- 5. Install guide (Figure 66, item 1) and retaining clip (Figure 66, item 2) to conveyor side rail with socket head screw (Figure 66, item 3).

Figure 66

Heavy Duty Fully Adjustable Guiding

1. Install guide bracket assembly (Figure 67, item 1) into the conveyor T-slot (Figure 67, item 2).

Figure 67

 Tighten screws (Figure 68, item 1) making sure T-nut (Figure 68, item 2) rotates and engages inside of the Tslot.

Figure 68

3. Loosen screw (Figure 69, item 1) on end of shaft (Figure 69, item 2) to remove clip (Figure 70, item 1).

Figure 69

Figure 70

4. Snap clip (Figure 71, item 1) onto guide rail (Figure 71, item 2).

5. Reassemble clip (Figure 72, item 1) and attach to shaft (Figure 72, item 2). Tighten screw (Figure 69, item 1) on end of shaft.

Figure 72

6. Adjust rail width with top screw (Figure 73, item 1).

Figure 73

7. Adjust rail height with lower screw (Figure 74, item 1).

Figure 74

Puck/Pallet Guiding

1. Install clip assembly (Figure 75, item 1) into side rail channel (Figure 75, item 2). The end clips should be no greater than 12" from the end of the conveyor.

Figure 75

NOTE

Make sure that the studs (Figure 75, item 4) rotate inside the channel and engage with the conveyor.

- 2. Fasten clip (Figure 75, item 1) to conveyor with nut (Figure 75, item 3) on stud.
- 3. Tighten nuts (Figure 76, item 1).

NOTE

Be certain that slot (Figure 76, item 2) is close to vertical when finished tightening nut.

Figure 76

4. Attach slide rail (Figure 77, item 1) to guiding (Figure 77, item 2).

NOTE

If guide length is less than 250 mm (10"), pin plastic guide to rail using slide rail screw and cutting flush.

5. Attach guiding (Figure 78, item 1) to clip (Figure 78, item 2) and tighten screw (Figure 78, item 3).

Adjustable Guide Rail Bracket

 Fasten an adjustable guide rail bracket support (Figure 79, item 1) to the conveyor beam using T-bolt (Figure 79, item 2).

Figure 79

 Attach the guide rail (Figure 80, item 1) to the clamp (Figure 80, item 2). Tighten the screw (Figure 80, item 3). Remember, do not over tighten the screw.

Figure 80

3. Use a wrench (Figure 80, item 4) to tighten the guide rail to the frame. Remember, do not over tighten the screw. Install remaining brackets.

Assembly with Different Guide Rail Support

Option 1

Option 2

Figure 81

Figure 82

NOTE

Tighten the screws when the position is justified.

FlexMove FV (260 mm) Conveyor System

FGRF- 42x18V Guide Rail Bracket Assembly

1. Prepare the heavy-duty guide rail bracket (Figure 83, item 1) with T-bolt (Figure 83, item 2).

Figure 83

2. Attach the bracket onto conveyor beam and tighten with a socket wrench (Figure 84, item 1).

Figure 84

Assembly with Different Guide Rail Support

Option 1

Figure 85

Figure 86

Option 3

Figure 87

FGRF- 42x18V Spacer Assembly

 Attach the spacer (Figure 88, item 1) onto FGRF- 42x18V (Figure 88, item 2) and install correct length T-bolt (Figure 88, item 3).

Figure 88

2. Attach the bracket onto conveyor beam and tighten with a socket wrench (Figure 89, item 1).

Figure 89

FGRB- 40x18, FGRB- 40x20 and FGRB- 40x15x20 Guide Rail Bracket Assembly

Method 1

1. Open the upper and lower caps (Figure 90, item 1) on FGRB - 40 guide rail bracket (Figure 90, item 2), and install T-bolt.

Figure 90

2. Attach the bracket onto conveyor beam and tighten with a socket wrench (Figure 91, item 1). Install upper and lower caps.

Figure 91

Assembly with Different Guide Rail Support

Option 1

Option 2

NOTE

Tighten all the screws when the position is justified. Remember to assemble the upper and lower caps onto the bracket.

Method 2

 Open the upper and lower caps (Figure 94, item 1) and prepare the FGRB - 40 guide rail bracket (Figure 94, item 2) with T-bolt.

Figure 94

2. Attach the bracket onto conveyor beam and tighten with a socket wrench. Install both caps of the bracket.

Figure 95

FlexMove FV (260 mm) Conveyor System

Fixed Guide Rail Bracket Installation

 Fasten a fixed guide rail bracket support (Figure 96, item 1) to the conveyor beam using T-bolt.

Figure 96

 Attach the guide rail (Figure 97, item 1) to the bracket (Figure 97, item 2). Clamp the spring pin into the slot between bracket and guide rail to the fixed position.

Figure 97

Guide Rail Connecting Installation

Rail Connecting

1. Slide the guide rail sleeve (Figure 98, item 1) into either one of the guide rail profile that you are going to join.

2. Move the guide rail sleeve into second profile. Tighten set screws.

Figure 99

Connecting Plug

1. Connecting plugs (Figure 100, item 1) are pressed into two guide rail ends with soft hammer.

Figure 100

Guide Rail Cover Installation

1. To prevent products from being scratched, a plastic guide rail cover (Figure 101, item 1) can be snapped on to the inside of the guide rail.

Figure 101

2. Make sure that all cover joints (Figure 102, item 1) are smooth, so that products do not get caught or damaged. Covers are not required on guide rail joints.

Figure 102

Final Preparations

Plug Beam Ends

Ensure that end caps have been fitted to all aluminium profile ends. The beam profiles should be deburred before fixing end caps. It may be necessary to fix the cap into position using a soft-faced hammer.

Anchor Feet to the Floor

After the assembly of all components, it is recommended to anchor the conveyor support feet to the floor. Use a type of fastener that is right for the kind of floor where the conveyor is installed.

Instability of the conveyor during operation may result in a dangerous operating environment or damage the conveyor components.

Other Preparations

- Adjust the height of the structural beam if necessary.
- Make sure that the installation is stable and that all screws have been properly tightened.
- Make sure that all electrical equipment and power supply are properly connected.
- Make sure that the conveyor is running in the correct direction before starting the conveyor!
- Tighten the slip clutch to a suitable friction.
- Make sure that all chain and belt covers are attached correctly.
- In pallet installations, make sure that all pneumatic equipment is properly connected.

NOTE

Remember that conveyor chains should always be pulled, not pushed, by the drive unit.

Start-Up and Testing

Safety Considerations

To eliminate the risk of accidents, it is important to be aware of certain areas of the conveyor where special caution is required, during installation, operation, and maintenance. Some areas present a higher danger to personal safety, and various kinds of safety devices need to be installed.

- All pinch and shear points as well as other exposed moving parts that present a hazard to employees at their workstations or their passageways must be safeguarded.
- Cleated conveyor chains are more susceptible of creating pinch and shear points than plain chain.
- When two or more pieces of equipment are interfaced, special attention must be given to the interfaced area to ensure proper safeguarding.
- For overhead equipment, guards must be provided if products may fall off the equipment for some reason. The same applies to all incline, decline, and vertical conveyors.

Safeguarding can be achieved by:

- Location locate the hazardous area out of reach of the personnel involved.
- Guards mechanical barriers preventing entry into the hazardous area or protecting against falling goods.
- Control devices machine controls preventing or interrupting hazardous conditions.
- Warnings instructions, warning labels, or sound or light signals, alerting on hazardous conditions.
- Warnings shall be used when other means of safeguarding will impair the function of the installation.

WARNING

It must be difficult to bypass or inactivate safeguards during operation! Safety devices should be designed to minimize discomfort or difficulties for operators.

Torque Limiter Adjustment for Suspended Drive Units

Introduction

The slip clutch on the drive unit is a safety device which allows the chain to stop if the load becomes excessive. It has two purposes:

- · Prevent damage to conveyor
- Prevent damage to the products on the conveyor (See Figure 103.)

Name of Parts

Figure 103

- 2 Friction Facing
- 3 Bushing
- 4 Pressure Plate
- 5 Disk Spring
- 6 Lock Washer
- 7 Pilot Plate
- 8 Adjustable Bolt

Torque Setting

NOTE

It may be easier to adjust torque limiter off of conveyor to adequately secure inner race with shaft locked in a vise while turning adjusting nut.

Tighten adjusting nut hand tight (approximately ¼ turn after first making contact). Mark nut flat closest to keyway. Continue to tighten to specified rotation to achieve desired torque: Note - For maximum drive torque use solid sprocket with no overload catenary protection.

| Rotation Angle | Slip Torque | Chain Pull |
|-------------------|----------------|---------------|
| 60 Degrees | 21 Nm | 328 N |
| 120 Degrees | 35 Nm | 547 N |
| 180 Degrees | 46 Nm | 719 N |
| 240 Degrees | 54 Nm | 844 N |
| Solid Sprocket | - | 1250 N |

Once adjusted nut is tightened to desired rotation, bend locking tabs down against nut flats in at least 2 locations.

Replace the Friction Facing

Change the friction facing when they reach roughly half the thickness of 1.6 mm (0.063 in.). Before replacing the friction facing, each part must be completely free of oil, rust and dirt.

Maintenance and Precautions after the Replacement Procedure

Replace the friction facing and bushing if they wear.

Keep the torque limiter free from water and oil. If torque limiter slips, re-adjust as necessary.

Safety

WARNING

- Before carrying out maintenance, make sure there is no load or turning force applied to the machine.
- Inspect operation periodically for overloads.

ACAUTION

• Mechanical parts may wear depending on the rotation speed and slipping time. Check the operation periodically.

Start-Up and Maintenance Schedule

The chains are made of acetyl resin, which has an excellent combination of strength, wear, chemical resistance, impact strength and temperature range. Chain failures like breakage, pin bending, and high wear might occur if the actual pull is higher than the permissible chain limit. There is also high risk of slip-stick effect if the conveyor is running at high chain tension.

It is important for the chain to run in the correct direction. The chain is marked with direction of travel by an arrow on the side of the chain. Over tensioning the chain can cause chain failure. Signs of over tensioning and overloading are broken links or bent link pins. On catenary drive units it is important that there is visible chain slack on the bottom of the drive units when running.

Chain Lubrication

Lubrication of the chain where it meets the slide rails and inside by the pin and pivot location can reduce friction allowing the chain to run more smoothly, quietly, and last longer. Spray silicon with TeflonTM is the recommended lubrication, and can be applied at the drive tail to the inside of the chain through the slot in the catenary drive tails or gravity take-up units.

Wear

The degree of wear on a conveyor depends on a number of factors, such as:

- Running time
- Load, contact pressure
- Speed
- · Product accumulation
- · Sharp or rough products
- Chemicals
- Foreign particles, e.g. chips, grinding particles, broken glass, sand, sugar
- Temperature
- Plain bends

Try to minimize the running time for the conveyor by stopping it when there is no transport. Multiple horizontal and vertical plain bends in a conveyor will often result in increased wear.

Chain Elongation

Acetyl resin is an elastic material. In addition to the elastic elongation, the chain will exhibit elongation because of material creeping. The magnitude of chain elongation will depend on the chain tension. Unless a weighted take-up is used, the chain elongation will show up at the bottom of the drive unit. Too much of the chain slack may cause high wear at the drive unit entry point. Chain slack of up to 150 mm (5.9 in.) is acceptable during normal running but any slack longer than that is not advisable. The chain slack might also hit on any part below it. For this case, the chain slack should be shortened much earlier. In a normal case, chain should be shortened after run-in time of 40 hours. The next inspection should be made after 200 hours of running and then every 1600 hours. More frequent inspections are recommended if the conveyor is long and has high load.

The chain should never be so tight that there is no slack during the operation. If there is too much slack, there will be excessive wear on the chain guides and the chain. This could be a risk for injury. If the slack on the conveyor chain is unacceptably high, it must be shortened by splitting the chain and removing the necessary number of links.

• The conveyor chain must show some slack during operation (See Figure 104).

Figure 104

• The conveyor chain does not need to show any slack when the conveyor chain is stationary or when a weighted takeup is used.

Preventive Maintenance and Adjustment

Inspection

Visually check the slide rail in horizontal and vertical bends after every 200 hours of operation. The chain can stay in place during the inspection. Replace any worn out slide rail. Remove the chain from the conveyor and inspect the slide rail carefully once every 1500 hours of operation. Check for any worn out slide rail and any other unusual conditions and make necessary replacement. Clean up any dirt accumulation in the conveyor beam, especially before any plain bends, drive unit, and idler end.

Drive Unit

The drive unit can be equipped with different gear motor brands. Please follow the maintenance recommendations from the manufacturer.

Maintenance Schedule

Maintenance is recommended to be carried out every 3rd, 6th and 12th month, and subsequently every 6th month, considering the running condition. Following are the recommended actions to be carried out:

First 3rd Month, 6th Month, and Every 6th Month Following

- Shorten the chain, if required.
- Visually inspect the condition of the slide rail, sprocket, wheel, and chain guides.
- Check any high wear part on the conveyor, and replace when necessary.
- Clean up any foreign accumulation that might block the smooth flow of the conveyor.
- Check the gearbox oil level and top off when necessary.
- Check all support structures, slide guides, and conveyor joints for looseness. Replace when necessary.

Checking Slide Rail with the Conveyor Chain in Place

The slide rail needs to be checked after every 200 hours of operation. Check on a stationary state with the chain in place. **Figure 105** shows the correct configuration of joints.

Figure 105

- Check the screwing points on the slide rail.
- Check the joints section on the slide rail.
- Check that the gap (Figure 106, item 1) between the slide rails and that the joints fit correctly.

- Check that the nylon screw is in place and does not protrude over the surface of the slide rail.
- Check that the joint sections are not deformed.

Preventive Maintenance and Adjustment

Checks When the Chain is Removed

The slide rail needs to be checked once a year or after 1500 hours of operation. The chain should be removed from the conveyor beam for checking the slide rail. Check carefully on the condition of wear and the screws.

Horizontal Bends

Horizontal bends need to be checked carefully after every 200 hours of operation.

Check the inner slide rail in horizontal bends carefully, since the friction here is particularly high. The conveyor chain develops more pressure on the inner slide rail compared to the outer slide rail.

- Check the slide rail for scratches and notches.
- Replace the slide rail and the screws, if necessary.
- Clean the conveyor chain and check the condition of the chains.
- Clean the conveyor beam.

Safety Devices

Safety devices should be checked at regular intervals.

• Check the motor cover for the suspended drive (See Figure 107).

Figure 107

- This motor cover must always be in place when the conveyor is operating.
- The drive unit should always have a chain cover to protect the safety of the users. The chain slack can be seen when the conveyor is running at the drive unit. Check that the chain cover plates are in place, and that the chain does not slacken enough to hang below the plates (Figure 108).

Figure 108

• Check that the chain cover is in place for the conveyor chain on the intermediate drive units and the catenary drive units.

Preventive Maintenance and Adjustment

Troubleshooting

| Symptom | Cause | Corrective Action |
|---------------------------------|---|---|
| Jerky running | Damage or badly fitted slide rail. | Inspect and replace as necessary. |
| | Incorrectly adjusted slip clutch. | Adjust slip clutch. |
| | Worn transmission parts. | • Check/replace transmission chain, chain drive sprocket. |
| | Conveyor chain is too tight or loose.Dirty conveyor. | Lubricate chain with silicone spray with Teflon[™]. |
| | | Tension conveyor chain correctly. |
| | | Clean conveyor chain/slide rail. |
| | | Add weighted take-up. |
| Drive unit is running; conveyor | Incorrectly adjusted slip clutch. | Check adjustment of slip clutch. |
| chain is not running | • Friction discs in slip clutch are | Check and replace if necessary. |
| | worn or contaminated. | Check the free running of the conveyor chain. |
| | Damage/badly fitted slide rail. | Check and fit. |
| | • Transmission products are not fit- ted. | |
| Motor overheating on drive unit | Overloaded conveyor. | Remove products from conveyor and test run. |
| | Gearbox leaking oil.Dirty conveyor. | Check actual conveyor load against recommended load- |
| | | ing. If possible, add breaks to add more drives. |
| | | Check output shaft seal and area around motor/gearbox interface. |
| | | Clean the conveyor chain with warm water. |
| Noise | Worn or damaged bearings in drive | Check/replace drive unit. |
| | unit.Damage/badly fitted slide rail. | • Check the free running of the conveyor chain, especially in slide rail joints. |
| | Excessive conveyor speed. | Check actual load against recommended loading. |
| | Incorrect conveyor chain tension. | Lubricate chain with silicone spray with Teflon[™]. |
| | | Lengthen or shorten conveyor chain. |
| Abnormal wear of plastic parts | Overloaded conveyor. | Remove products from conveyor and test run. |
| | Ambient temperature too high. | Check the free running of the conveyor chain. |
| | Foreign object dropped on the con- veyor chain. | Check actual conveyor load against recommended load- ing. If possible, add breaks the conveyor and add more drives. |
| | | • Check against recommended temperature for conveyor. |
| | | Replace the broken section of chain. |
| Clutch Ratcheting or slipping | Excessive or accumulated load. | Avoid load buildup by running conveyor continuously. |
| | Improper ratchet clutch tensioning. | Do not manually surge load conveyor. |
| | Damaged or missing chain assembly parts. | Refer to ratchet clutch adjustment in Maintenance. |
| | | Review belt and repair or replace as required. |
| | Accumulation of conveyed material or foreign objects inside of casing. | Remove chain and clean out. |

Required Tools

- 3/32" hex wrench
- 3 mm hex wrench
- 4 mm hex wrench
- 5 mm hex wrench
- 6 mm hex wrench
- 8 mm hex wrench
- 10 mm wrench
- 13 mm wrench
- 16 mm wrench
- Chain Removal Tool
- Slide Rail Cutter
- Drill Fixtures for Slide Rails
- Riveting Tool

Conveyor Chain Replacement

SEVERE HAZARD!

LOCK OUT POWER before removing guards or performing maintenance. Exposed moving parts can cause serious injury.

Replacing a Section or Entire Chain

1. Use chain removal tool or a punch and hammer to push the chain rod (Figure 109, item 1) out.

Figure 109

SEVERE HAZARD!

If conveyor chain is damaged or worn, replace chain section.

2. Replace old section of chain.

ACAUTION

DO NOT reuse chain rods that are damaged, bent, or show signs of wear.

NOTE

Drive spindle shaft assembly replacement is recommended with belt replacement (see "Drive Spindle Shaft Replacement" on page 39).

Conveyor Chain Tensioning

NOTE

Belt should not be stretched during installation. A proper length of belt can be installed by interlocking the ends by hand without excess links.

1. Remove one or more chain links to take up tension. Refer to "Replacing a Section or Entire Chain" on page 37.

NOTE

After shortening chain, ensure there is visible slack in chain (while running) at catenary drive tails. If chain is not visible in cover slot (Figure 110, item 1) inspect from end.

Figure 110

Slide Rail Replacement

Replace the slide rails if they become worn.

NOTE

Top and bottom slide rails are shipped pinned/attached at various places on conveyor.

- 1. Remove belt. See "Conveyor Chain Replacement" on page 37.
- 2. Drill out or push out drilled pinned screws or rivets (Figure 111, item 1).
- 3. Remove slide rail (Figure 111, item 2) from top of frame assembly.

- 4. Cut and remove worn slide rail section and replace with new slide rail. See "Installation" section, starting on page 15.
- 5. Remove lower slide rails, as needed, repeat procedure used for upper slide rails.
- 6. Install new slide rails. See "Installation" section, starting on page 15.

Idler Pulley Replacement

 Remove chain. See "Conveyor Chain Replacement" on page 37.

 Remove outer plates (Figure 112, item 1) and connecting hardware by removing two screws (Figure 112, item 2) on both sides of the conveyor.

Figure 112

3. Remove flat head screw (Figure 113, item 1).

Figure 113

4. Remove the head plate (Figure 114, item 1) from the idler end.

Figure 114

5. Remove flat head screw (Figure 115, item 1) and remove idler pulley (Figure 115, item 2) from idler head plate assembly.

Figure 115

6. Install components reverse of removal.

Drive Spindle Shaft Replacement

injury. LOCK OUT POWER before removing guards or performing maintenance.

- 1. Remove chain. See "Conveyor Chain Replacement" on page 37.
- 2. Remove the gearmotor.

Loosen two screws (Figure 116, item 1) on each side of conveyor, and remove the drive tail assembly (Figure 116, item 2) from the conveyor frame (Figure 116, item 3).

Figure 116

4. Remove four screws (Figure 117, item 1) on side of drive spindle.

Figure 119

Figure 117

5. Remove two screws (Figure 118, item 1) on side of drive spindle.

Figure 118

Figure 120

7. Remove the head plates (Figure 121, item 1) from the drive tail.

Figure 121

8. Install components reverse of removal.

Retaining Guide Replacement

Cantenary Drive End

1. Remove three socket head screws (Figure 122, item 1) and remove drive plate guard (Figure 122, item 2) from drive plate (Figure 122, item 3).

Figure 122

2. Remove two screws (Figure 123, item 1) from outer plates (Figure 123, item 2).

Figure 123

3. Remove drive return guide (Figure 124, item 1).

Figure 124

4. Remove two screws (Figure 125, item 1) from inside plates.

Figure 125

5. Remove lower retaining guide (Figure 126, item 1) from drive plate (Figure 126, item 2).

Figure 126

6. Remove three socket head screws (Figure 127, item 1).

Figure 127

7. Remove upper retaining guide (Figure 128, item 1) from drive plate (Figure 128, item 2).

Figure 128

8. Install components reverse of removal.

Idler End and GP Drive Tail

1. Remove seven (7) socket head screws (Figure 129, item 1) from idler head plate assembly.

2. Remove retaining guide (Figure 130, item 1) from idler head plate assembly (Figure 130, item 2). Replace components, as needed.

Figure 130

3. Install components reverse of removal.

Weighted Take-Up

1. Remove two socket head screws (Figure 131, item 1) on each side securing assembly to frame.

Figure 131

2. Lower weighted take up assembly (Figure 132, item 1) from conveyor (Figure 132, item 2) by disengaging locking teeth (Figure 132, item 3) on both sides.

Figure 132

 Use two wrenches to remove nut (Figure 133, item 1) on bolt securing wheel (Figure 133, item 2) onto weighted take up assembly housing (Figure 133, item 3).

Figure 133

4. Remove bolt (Figure 134, item 1), washer (Figure 134, item 2), two spacers (Figure 134, item 3), and wheel (Figure 134, item 4) from take up assembly housing (Figure 134, item 5).

Figure 134

5. Remove idler pulley assembly (Figure 135, item 1) from belt (Figure 135, item 2).

Figure 135

6. Remove socket head screw (Figure 136, item 1) from end of idler pulley assembly.

Figure 136

Remove bolt (Figure 137, item 1), washer (Figure 137, item 2), spacer (Figure 137, item 3), wave washer (Figure 137, item 4), and plate (Figure 137, item 5) from end of idler assembly (Figure 137, item 6).

Figure 137

- 8. Repeat on opposite side.
- 9. Remove weights (Figure 138, item 1) from each side of pulley (Figure 138, item 2).

Figure 138

10. Install components reverse of removal, using two hex wrenches (Figure 139, item 1) on each side of idler assembly to tighten components.

NOTE

Be certain that notches (Figure 139, item 2) on both plates are on top side, and spacers are in same orientation, as shown, before tightening components.

Figure 139

11. Install idler pulley assembly (Figure 140, item 1) onto conveyor in belt loop (Figure 140, item 2).

Figure 140

12. Install remaining components reverse of removal. (For installation instructions, refer to "Weighted Take-Up" on page 21 in the Installation section.)

Power Transfer

Removal

1. Remove two socket head screws (Figure 141, item 1) and cover (Figure 141, item 2) from power transfer assembly.

 Loosen two socket head screws (Figure 142, item 1) holding tensioning pulley (Figure 142, item 2) onto timing belt (Figure 142, item 3).

Figure 142

- 3. Remove timing belt (Figure 142, item 3) from assembly.
- 4. Loosen idler socket head screw (Figure 143, item 1) on both sides of the conveyor.

Figure 143

- 5. Slide idler assembly within slot (Figure 143, item 2) to remove tension on belt.
- 6. Remove two socket head screws (Figure 144, item 1) and pinch guard (Figure 144, item 2).

Figure 144

7. Lift slightly on belt (Figure 145, item 1) and push pin (Figure 145, item 2) out of belt.

Figure 145

9. Remove four socket head screws (Figure 147, item 1) holding wear bar assembly (Figure 147, item 2) onto power transfer.

Figure 147

Figure 146

NOTE

Note that head of pin (Figure 146, item 1) should be removed in direction shown.

8. Remove belt.

10. Remove wear bar assembly (Figure 148, item 1) from power transfer.

Figure 148

 Disassemble side guide plates (Figure 149, item 1), wear rods (Figure 149, item 2), and wear bar (Figure 149, item 3). Replace worn components.

Figure 149

12. Remove socket head screw (Figure 150, item 1) on both sides of the conveyor and remove idler assembly.

Figure 150

13. Replace idler assembly (if worn), and install socket head screws to secure.

14. Loosen two set screws (Figure 151, item 1) on two bearings (Figure 151, item 2).

Figure 151

- 15. Loosen sprocket set screws (Figure 151, item 3).
- Remove drive shaft (Figure 152, item 1), making certain not to loose key (Figure 152, item 2) when removing gear (Figure 152, item 3).

Figure 152

17. Remove key (Figure 153, item 1) from sprocket (Figure 153, item 2).

Figure 153

18. Replace worn drive sprockets and bearings.

Installation

1. Install drive shaft (Figure 154, item 1) on two bearings (Figure 154, item 2) and press outward as shown.

Figure 154

2. Secure drive shaft onto bearings with two set screws (Figure 155, item 1).

Figure 155

3. Raise belt (Figure 156, item 1) into position, and move gear (Figure 156, item 2) so that cogs line up with belt, as shown.

Figure 156

4. Tighten sprocket with set screws (Figure 156, item 3) in proper alignment with belt (Figure 156, item 1).

5. Install wear bar assembly (Figure 157, item 1) with four socket head screws (Figure 157, item 2).

Figure 157

6. Guide belt (Figure 158, item 1) through idler assembly with belt routing under gear (Figure 158, item 2) and over wear tube (Figure 158, item 3).

Figure 158

7. Bring ends of belt together and install pin (Figure 159, item 1).

Figure 159

8. Install pinch guard (Figure 160, item 1) with two socket head screws (Figure 160, item 2).

Figure 160

 Slide idler assembly within slot (Figure 161, item 1) only enough to remove excess slack from belt (Figure 161, item 2). Tighten socket head screws (Figure 161, item 3).

ACAUTION

DO NOT overtighten belt or excessive wear will occur.

Figure 161

 Rotate drive shaft (Figure 162, item 1) to verify tightness of belt (Figure 162, item 2). Belt should turn freely. Loosen idler socket head screw (Figure 162, item 3) and adjust, if necessary.

Figure 162

11. Install timing belt:

• On idler end, route and install belt (Figure 163, item 1) as shown. Press up on tensioner (Figure 163, item 2) and tighten two socket head screws (Figure 163, item 3).

Figure 163

• On drive end, route and install belt (Figure 164, item 1) as shown. Press down on tensioner (Figure 164, item 2) and tighten two socket head screws (Figure 164, item 3)

12. Install cover (Figure 165, item 1) with two socket head screws (Figure 165, item 2).

Notes

NOTE

For replacement parts other than those shown in this section, contact an authorized Dorner distributor or Dorner directly. Recommended Critical Service Parts and Kits are identified by the Key Service Parts symbol 🖙 . Dorner recommends keeping these parts on hand.

Drive Tail

FlexMove FV (260 mm) Conveyor System

| Item | Part Number | Description |
|------|---------------|-------------------------------------|
| 1 | FMD83101-A | Retaining Guide Set (2 Pairs) |
| | | |
| 2 | FU-A2016 | Belt Capture Guide Set (Pair) |

Notes

Return Policy

Returns must have prior written factory authorization or they will not be accepted. Items that are returned to Dorner without authorization will not be credited nor returned to the original sender. When calling for authorization, please have the following information ready for the Dorner factory representative or your local distributor:

- 1. Name and address of customer.
- 2. Dorner part number(s) of item(s) being returned.
- 3. Reason for return.
- 4. Customer's original order number used when ordering the item(s).
- 5. Dorner or distributor invoice number. Include part serial number if available.

A representative will discuss action to be taken on the returned items and provide a Returned Materials Authorization (RMA) number for reference. RMA will automatically close 30 days after being issued. To get credit, items must be new and undamaged. There will be a return charge on all items returned for credit, where Dorner was not at fault. It is the customer's responsibility to prevent damage during return shipping. Damaged or modified items will not be accepted. The customer is responsible for return freight.

| | | Product Type | | | | | | | |

| AquaGard 7350/7360 Series | non-returnable | | | | | | | | |
| AquaPruf Series | 1 | | | | | | | | |

Returns will not be accepted after 60 days from original invoice date. The return charge covers inspection, cleaning, disassembly, disposal and reissuing of components to inventory. If a replacement is needed prior to evaluation of returned item, a purchase order must be issued. Credit (if any) is issued only after return and evaluation is complete.

Dorner has representatives throughout the world. Contact Dorner for the name of your local representative. Our Customer Service Team will gladly help with your questions on Dorner products.

For a copy of Dorner's Warranty, contact Dorner, an authorized sales channel or visit our website: www.dorner.com.

For replacement parts, contact an authorized Dorner Service Center or the factory.
